

Press Release

Monday, September 24th, 2018

Our product “iVault” was introduced in August to an exclusive audience by Prof. Eric Bern-hard. The introduction took place at an event hosted by Germany’s most renowned newspaper the “Frankfurter Allgemeine Zeitung” sponsored by the Blockchain Institute in Frankfurt.

We received positive feedback from the attendees, who were mostly from the blockchain technology scene, which is growing at a very fast pace. New business relationships were built and based upon the positive response we received, an invitation to speak again to an even larger audience on November 15th at the FAZ premises in Frankfurt. Attendees of the upcoming event will include the Minister of Finance, Mr. Olaf Scholz.

„We consider Germany one of our key markets in Europe since many items get reported stolen or lost annually and our goal is to solve this problem. The market introduction of our product in this country and the transparency of iVault are among our core business objectives” says CEO Arman Sarhaddar.

Vault is the world’s first global network to use blockchain technology for registering and identifying assets (such as lost items or stolen property). The network – which is open to everyone – lets users register their items on the blockchain, plus search for and identify items. These assets can be almost anything of value to the owner.
